No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

a

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Pred. No.

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil pal groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and

                                                                                             The present sequence represents the bean phaseolin promoter, which is used to construct plasmids for the expression of the P. putidated fands gene. The gene encodes an enzyme that may be used in the method of the invention. The specification describes a method for manipulating the metabolism of a plant, and comprises expressing a heterologous gene encoding fatty acid oxidation enzymes in the cytosol or plastids other than the peroxisomes, glyoxisomes or mitochondria of the plant. The method may be used to enhance the biological production of polyhydroxyalkanoates or novel oil compositions in a transgenic plant. Plants which may be used to produce these compounds in this way include Brassicas, maize, soybean, cottonseed, sunflower, palm, coconut, safflower, peanut, mustards, flax, tobacco and alfalfa. The method may also be used to prevent or suppress seed production and therefore increase the production of biomass (leaves,

Modifying fatty biomass and prod producing specific poly n in plants, useful polymers in seeds for increasing

Example Ψ Page 79pp; English.

CC The present sequence represents the bean phaseolin terminator, which CC is used to construct plasmids for the expression of the P. putida CC faoAB gene. The gene encodes an enzyme that may be used in the CC method of the invention. The specification describes a method for CC manipulating the metabolism of a plant, and comprises expressing a CC heterologous gene encoding fatty acid oxidation enzymes in the CC cytosol or plastids other than the peroxisomes, glyoxisomes or CC mitochondria of the plant. The method may be used to enhance the CC biological production of polyhydroxyalkanoates or novel oil compositions CC compounds in this way include Brassicas, maize, soybean, cottonseed, CC sunflower, palm, coconut, safflower, peanut, mustards, flax, tobacco and CC alfalfa. The method may also be used to prevent or suppress seed CC production and therefore increase the production of biomass (leaves, XX stalks) by plants.

Sequence 1244 BP; 456 A; 174 ე 178 <u>.</u> 436 ;; 0 other

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.

cc expression constructs to lower soybean vacuolar protein, commonly known cc as p34 (Gly m Bd 30K or Gly m 1) and other allergens such as Gly m IA, CC Gly m IB, rGLY m3 or Glycinin G1 (alaBlb). The allergen content of the expression is reduced by sense suppression which is accomplished by using ct the expression construct that comprises a nucleic acid fragment encoding ct transgenic soybean plants which can be used to make hypoallergenic cc soybean products which can be used to make hypoallergenic cc soybean products which can be used in a variety of food (e.g. infant cc formulas) and animal feed applications. The oil made from seeds of the hypoallergenic transgenic soybean plants can be used as ingredients, as coatings, as salad oils, as spraying oils, as roasting oils, and snack foods, confectionery products, syrups and toppings, sauces, batter and breading mixtures, baking mixes and doughs. The present cc sequence is a DNA encoding kunitz soybean trypsin inhibitor (KSTI cc KTi3), a minor soybean seed allergen.
